- Single Sideband (SSB)

Common Viva Questions on Analog Communication with Answers

Below is a compilation of frequently asked viva questions along with detailed answers to help prepare for exams.

1. What is Modulation? Why is it used in communication systems?

Answer: Modulation is the process of varying a carrier signal's parameters (amplitude, frequency, or phase) in accordance with a message or baseband signal. It is used to:

- Facilitate transmission over long distances
- Improve signal robustness and immunity to noise
- Enable multiplexing of multiple signals
- Match the carrier signal's frequency with the transmission medium's frequency

2. Explain the concept of Amplitude Modulation (AM).

Answer: In amplitude modulation, the amplitude of the high-frequency carrier wave is varied in proportion to the message signal. The modulated wave contains the original message information in its envelope. The mathematical expression for an AM wave is:

$$s(t) = [A_c + m(t)] \cos(\omega_c t)$$

where:

- A_c = amplitude of carrier
- $m(t)$ = message signal
- ω_c = angular frequency of carrier

3. What are the advantages of AM?

Answer:

- Simplicity of transmitter and receiver design
- Ease of generation and demodulation
- Suitable for broadcasting over large areas

4. List the disadvantages of AM.

Answer:

- Susceptibility to noise and interference

- Inefficient power usage
- Large bandwidth requirement
- Low power efficiency

5. Define Frequency Modulation (FM). How does it differ from AM?

Answer: FM involves varying the frequency of the carrier wave in proportion to the message signal, while maintaining a constant amplitude. The instantaneous frequency of the carrier is shifted according to the message signal. Unlike AM, which encodes information in amplitude variations, FM encodes information in frequency variations, providing better noise immunity.

6. What is the bandwidth of an FM signal? State Carson's rule.

Answer: The bandwidth of an FM signal is given by Carson's rule:

$$BW = 2(\Delta f + f_m)$$

where:

- Δf = peak frequency deviation
- f_m = maximum frequency of message signal

This rule estimates the total bandwidth occupied by the FM signal, which is generally larger than the message bandwidth.

7. Describe the process of demodulation in AM and FM.

Answer:

- AM Demodulation: Uses a diode detector or envelope detector to extract the message signal from the modulated carrier.
- FM Demodulation: Uses frequency discriminators, phase-locked loops (PLLs), or ratio detectors to recover the original message signal from the frequency variations.

8. What is the significance of sidebands in AM?

Answer: Sidebands are the frequency components generated during modulation, located above and below the carrier frequency. They contain the actual information (message signal). The carrier itself does not contain data but facilitates the transmission of sidebands.

9. Explain the concept of Double Sideband Suppressed Carrier (DSB-SC) modulation.

Answer: DSB-SC involves modulating the carrier with the message signal but suppresses the carrier in the transmitted signal. The transmitted wave contains only the sidebands, which makes it more power-efficient. Demodulation requires a coherent detector that reintroduces the carrier.

10. What are the advantages and disadvantages of DSB-SC?

Answer:

- Advantages:
- Power efficiency due to the absence of carrier transmission
- Better utilization of power
- Disadvantages:
- Requires a coherent carrier for demodulation
- More complex receiver circuitry

Technical Concepts and Calculations

Understanding the technical aspects and being able to perform related calculations are often part of viva questions.

11. Derive the expression for the amplitude-modulated wave.

Answer: Starting from the message signal $m(t)$ and carrier $c(t) = A_c \cos(\omega_c t)$,

$$s(t) = [A_c + m(t)] \cos(\omega_c t)$$

If $m(t) = A_m \cos(\omega_m t)$,

$$s(t) = A_c \cos(\omega_c t) + A_m \cos(\omega_m t) \cos(\omega_c t)$$

Using the product-to-sum formula:

$$s(t) = A_c \cos(\omega_c t) + \frac{A_m}{2} [\cos(\omega_c + \omega_m)t + \cos(\omega_c - \omega_m)t]$$

This shows the carrier and the two sidebands.

12. How is the modulation index defined in AM?

Answer: The modulation index, (μ) , is the ratio of the message signal amplitude to the carrier amplitude:

$$\mu = \frac{A_m}{A_c}$$

It indicates the extent of modulation; $(\mu \leq 1)$ for normal modulation.

13. Calculate the total power in an AM wave.

Answer: Total power is the sum of the carrier power and sideband power:

$$P_{\text{total}} = P_c \left(1 + \frac{\mu^2}{2} \right)$$

where $(P_c = \frac{A_c^2}{2R})$, with (R) being load resistance.

14. How do you determine the bandwidth of an AM signal?

Answer: The bandwidth of an AM signal is twice the maximum frequency of the message signal:

$$BW = 2f_m$$

where (f_m) is the highest frequency component in the message.

15. What are the key differences between AM and FM?

Answer:

Aspect	AM	FM
Modulation parameter	Amplitude	Frequency
Bandwidth	Narrow	Wide
Noise immunity	Poor	Good
Power efficiency	Less	More

| Complexity | Simpler | More complex |

Practical and Conceptual Questions

Some viva questions focus on real-world applications and conceptual understanding.

16. Why is FM preferred over AM in high-fidelity broadcasting?

Answer: FM offers better noise immunity and higher fidelity because it is less affected by amplitude variations caused by interference. Its wider bandwidth allows for higher quality sound transmission, making it suitable for high-fidelity audio broadcasting.

17. What are the challenges faced in analog communication systems?

Answer:

- Noise and interference susceptibility
- Limited bandwidth efficiency
- Power inefficiency
- Signal distortion over long distances
- Difficulty in multiplexing large numbers of channels

18. How does a superheterodyne receiver work in analog communication?

Answer: The superheterodyne receiver converts the received radio frequency (RF) signal to a fixed intermediate frequency (IF) by mixing it with a locally generated oscillator signal. This simplifies filtering and amplification, improving selectivity and sensitivity.

19. Explain the importance of sideband suppression in communication systems.

Answer: Suppressing unwanted sidebands or the carrier reduces bandwidth usage and power consumption. Techniques like SSB modulation are used to improve efficiency, especially in satellite and amateur radio communications.

20. What are the applications of analog communication?

Answer:

- Radio broadcasting
- Television transmission
- Telephone communication
- Radar systems
- Audio and video transmission over wired and wireless channels

Sample Solved Problems in Amplitude Modulation

Problem 1: Calculating Modulation Index and Bandwidth

Given:

- Message signal amplitude $A_m = 2$ V
- Carrier amplitude $A_c = 10$ V
- Message signal frequency $f_m = 3$ kHz

- Carrier frequency $(f_c = 100)$ kHz

Find:

- a) Modulation index (μ)
- b) Bandwidth of the AM signal

Solution:

Step 1: Calculate modulation index (μ) :

$$\mu = \frac{A_m}{A_c} = \frac{2}{10} = 0.2$$

$$\mu = \frac{A_m}{A_c} = \frac{2}{10} = 0.2$$

$$\mu = \frac{A_m}{A_c} = \frac{2}{10} = 0.2$$

Step 2: Determine bandwidth:

$$BW = 2f_m = 2 \times 3 = 6 \text{ kHz}$$

$$BW = 2f_m = 2 \times 3 = 6 \text{ kHz}$$

$$BW = 2f_m = 2 \times 3 = 6 \text{ kHz}$$

Final Answer:

- Modulation index $(\mu = 0.2)$
- Bandwidth $(BW = 6 \text{ kHz})$

Problem 2: Power Distribution in AM Transmission

Given:

- Carrier power $(P_c = 10 \text{ W})$
- Modulation index $(\mu = 0.6)$

Find:

a) Total transmitted power (P_t)

b) Power in sidebands

Solution:

Step 1: Calculate total power (P_t) :

$$P_t = P_c \left(1 + \frac{\mu^2}{2}\right) = 10 \times \left(1 + \frac{0.6^2}{2}\right)$$

$$P_t = 10 \times \left(1 + \frac{0.36}{2}\right) = 10 \times (1 + 0.18) = 10 \times 1.18 = 11.8, \text{ W}$$

Step 2: Power in sidebands (P_{SB}) :

$$P_{SB} = P_t - P_c = 11.8 - 10 = 1.8, \text{ W}$$

Alternatively, since sideband power is distributed equally:

$$P_{USB} = P_{LSB} = \frac{\mu^2}{4} P_c$$

Calculating:

$$P_{USB} = P_{LSB} = \frac{0.6^2}{4} \times 10 = \frac{0.36}{4} \times 10 = 0.09 \times 10 = 0.9,$$

W

$\backslash$

Total sideband power:

$\backslash$

Final Answers:

- Total power $(P_t = 11.8 \text{ W})$
- Power in sidebands $(= 1.8 \text{ W})$

Problem 3: Spectrum Analysis ? Sidebands and Carrier Components

Given:

- Message signal $(m(t) = 5 \cos(2\pi \times 2 \text{ kHz} \times t))$

Thus,

[

$$s(t) = [20 + 5 \cos(2\pi \times 2 \text{ kHz} \times t)] \cos(2\pi \times 100 \text{ kHz} \times t)$$

]

Step 2: Expand the expression:

[

$$s(t) = 20 \cos(2\pi f_c t) + 5 \cos(2\pi f_m t) \cos(2\pi f_c t)$$

]

Use the product-to-sum identity:

[

$$\cos A \cos B = \frac{1}{2} [\cos(A+B) + \cos(A-B)]$$

]

Applying this:

[

$$s(t) = 20 \cos(2\pi f_c t) + \frac{5}{2} [\cos 2\pi (f_c + f_m) t + \cos 2\pi (f_c - f_m) t]$$

- Sidebands at 98 kHz and 102 kHz, each with amplitude proportional to $\frac{5}{2}$ V

Addressing Common Challenges in AM Problem Solving

While the above problems illustrate straightforward calculations, students and practitioners often encounter challenges such as:

- Misapplication of formulas: Ensuring the correct formulas are used for specific parameters.
- Misinterpretation of spectral components: Distinguishing between the carrier and sidebands.
- Assumptions about modulation index: Recognizing limits (e.g., $\mu \leq 1$) for standard AM).
- Unit consistency: Maintaining clarity in Hz, kHz, W, V, etc.

To mitigate these issues, it is recommended to:

- Cross-verify calculations
- Use diagrams and spectrum plots
- Keep track of units meticulously
- Practice a variety of problems to build intuition

Advanced Topics and Real-World Applications

Beyond basic problems, advanced scenarios involve:

- Suppressed carrier modulation: Where the carrier is minimized or eliminated.
- Double sideband suppressed carrier (DSB-SC): Requires different power calculations.

- Amplitude modulation in digital systems: Using AM principles in modern digital communications.

Understanding these complexities often involves solving more sophisticated problems, which build on the foundational skills discussed herein.

Conclusion

Amplitude modulation solved problems serve as a vital educational tool, bridging theoretical concepts with practical applications. Through detailed problem analysis and systematic solutions, learners can develop a nuanced understanding of how modulation parameters influence system performance. Mastery of these problems not only enhances academic achievement but also prepares engineers to design and troubleshoot real-world communication systems effectively.

As the landscape

Question What is the basic principle of amplitude modulation (AM)? Amplitude modulation involves varying the amplitude of a high-frequency carrier wave in proportion to the instantaneous amplitude of the message (or modulating) signal, thereby encoding the information onto the carrier wave. How do you calculate the modulation index in an amplitude modulation problem? The modulation index (m) is calculated using the formula $m = (A_{\max} - A_{\min}) / (A_{\max} + A_{\min})$, where $A_{\max}$ and $A_{\min}$ are the maximum and minimum amplitudes of the modulated wave. Alternatively, if the message signal amplitude and carrier amplitude are known, $m = (A_{\text{message}}) / (A_{\text{carrier}})$. Given a carrier wave of 1 MHz and a message signal of 2 kHz with a modulation index of 0.5, what is the bandwidth of the AM signal? The bandwidth (BW) of an amplitude-modulated wave is given by $BW = 2 \times f_m$, where f_m is the highest modulating frequency. Therefore, $BW = 2 \times 2 \text{ kHz} = 4 \text{ kHz}$. In an AM wave, if the carrier amplitude is 10 V and the modulation index is 0.6, what is the amplitude of the modulated wave's envelope? The envelope amplitude $A_{\text{env}} = A_{\text{carrier}} \times (1 + m) = 10 \text{ V} \times (1 + 0.6) = 10 \text{ V} \times 1.6 = 16 \text{ V}$. How do you determine the total power of an amplitude-modulated wave given the carrier power and modulation index? Total power $P_t = P_c (1 + (m^2)/2)$, where P_c is the power of the unmodulated carrier wave and m is the modulation index. This accounts for the additional sideband power introduced by modulation.

Question 3:

In Amplitude Modulation (AM), the message signal is used to vary which parameter of the carrier?

- A) Frequency
- B) Phase
- C) Amplitude
- D) Both frequency and phase

Answer: C) Amplitude

Question 4:

Which of the following is an example of digital modulation?

- A) Frequency Modulation (FM)
- B) Amplitude Modulation (AM)
- C) Phase Shift Keying (PSK)
- D) Continuous Wave (CW)

Answer: C) Phase Shift Keying (PSK)

Explanation: PSK is a digital modulation technique where the phase of the carrier signal is shifted to represent digital data bits.

Question 5:

- D) PSK

Answer: C) QAM

Explanation: Quadrature Amplitude Modulation (QAM) combines both amplitude and phase variations to encode data, allowing higher data rates.

Advanced Multiple Choice Questions on Modulation

For those seeking a deeper challenge, here are advanced MCQs:

Question 7:

In frequency modulation, the bandwidth of the modulated signal is given approximately by:

- A) The sum of the message bandwidth and the carrier frequency
- B) Twice the message bandwidth

C) The message bandwidth multiplied by the modulation index

D) The carrier frequency divided by the message bandwidth

Answer: C) The message bandwidth multiplied by the modulation index

Explanation: According to Carson's rule, the bandwidth of an FM signal is approximately $2(\Delta f + f_m)$, where (Δf) is the peak frequency deviation and (f_m) is the maximum message frequency. The modulation index $(\beta = \frac{\Delta f}{f_m})$, so bandwidth depends on modulation index and message bandwidth.

Question 8:

Which of the following digital modulation schemes can transmit the maximum number of bits per symbol?

A) BPSK

B) QPSK

C) 16-QAM

D) 8-PSK

Answer: C) 16-QAM

Explanation: 16-QAM encodes 4 bits per symbol (since $2^4=16$), which is higher than BPSK (1 bit), QPSK (2 bits), and 8-PSK (3 bits). Therefore, 16-QAM achieves the highest data rate per symbol among these options.

Sample Modulation MCQs with Answers and Explanations

To illustrate the depth and utility of modulation MCQs, below is a curated selection of questions across different difficulty levels, complete with detailed explanations.

Basic Concept Questions

Q1. What is the primary purpose of modulation in communication systems?

- a) To increase the amplitude of the message signal
- b) To enable the transmission of signals over long distances efficiently

- c) To decrease the bandwidth of the signal
- d) To eliminate noise from the signal

Answer: b) To enable the transmission of signals over long distances efficiently

Explanation:

Modulation modifies a carrier wave to carry information, making it suitable for transmission over communication channels. It helps in reducing signal attenuation, minimizing interference, and efficiently utilizing bandwidth, thus enabling long-distance communication.

Q2. Which of the following is NOT a common type of modulation?

- a) Amplitude Modulation (AM)
- b) Frequency Modulation (FM)
- c) Phase Modulation (PM)
- d) Power Modulation (PoM)

Answer: d) Power Modulation (PoM)

Explanation:

While AM, FM, and PM are standard modulation techniques, "Power Modulation" is not recognized as a standard modulation type. It may refer to adjusting power levels but is not a modulation method per se.

Application-Based Questions

Q3. In amplitude modulation (AM), how does increasing the modulation index affect the transmitted signal?

- a) It increases the bandwidth of the signal.
- b) It decreases the amplitude of the carrier.
- c) It reduces the sideband frequencies.

d) It has no effect on the bandwidth.

Answer: a) It increases the bandwidth of the signal.

Explanation:

The modulation index in AM determines the extent of amplitude variation of the carrier. Increasing the modulation index (up to 1 for standard modulation) increases the sideband amplitudes and bandwidth, since bandwidth in AM is given by $(BW = 2 \times \text{modulation frequency})$, which is indirectly affected by modulation depth.

Q4. Which modulation technique is most suitable for high-fidelity audio broadcasting?

a) Amplitude Modulation (AM)

b) Frequency Modulation (FM)

c) Phase Modulation (PM)

d) On-Off Keying (OOK)

Answer: b) Frequency Modulation (FM)

Explanation:

FM is preferred for high-fidelity audio broadcasting because it offers better noise immunity and captures audio nuances more effectively than AM. FM's resilience to amplitude noise makes it ideal for high-quality sound transmission.

Mathematical and Analytical Questions

Q5. Given a message signal with a frequency of 3 kHz and a carrier frequency of 100 kHz, what is the bandwidth of the amplitude-modulated signal?

a) 3 kHz

b) 6 kHz

c) 200 kHz

d) 94 kHz

Answer: b) 6 kHz

Explanation:

In standard AM, the bandwidth is twice the message frequency ($BW = 2 \times f_m$). So, $BW = 2 \times 3 \text{ kHz} = 6 \text{ kHz}$.

Q6. Calculate the modulation index for an AM signal with a carrier amplitude of 10V and a message signal amplitude of 4V.

a) 0.4

b) 2.5

c) 0.6

d) 4

Answer: a) 0.4

Explanation:

The modulation index $(m = \frac{\text{message amplitude}}{\text{carrier amplitude}} = \frac{4V}{10V} = 0.4)$.

Comparison and Concept Differentiation Questions

Q7. Which of the following statements correctly differentiates between FM and AM?

a) FM varies the amplitude of the carrier, while AM varies its frequency.

b) AM varies the amplitude of the carrier, while FM varies its frequency.

c) Both FM and AM vary the amplitude of the carrier.

d) Both FM and AM vary the frequency of the carrier.

Answer: b) AM varies the amplitude of the carrier, while FM varies its frequency.

Explanation:

Amplitude Modulation involves changing the carrier's amplitude in proportion to the message signal. Frequency Modulation involves varying the carrier's frequency according to the message signal.
