- Length: meters (m), centimeters (cm), millimeters (mm)
- Time: hours, minutes, seconds

Conversion Factors

- 1 g = 1000 mg
- 1 mg = 1000 mcg
- 1 L = 1000 mL
- 1 mL = 1 cc (cubic centimeter)

Tip: Always double-check unit conversions, especially when switching between weight and volume, as they are not interchangeable without proper density information.

- Ratios and Proportions

Ratios and proportions form the basis for many calculations, such as dilutions, concentrations, and dosage calculations.

How to Set Up Ratios and Proportions

- Identify known quantities and what you need to find.
- Set up the ratio or proportion accordingly.
- Cross-multiply to solve for the unknown.

Example:

If 10 mL of a solution contains 50 mg of drug, how much drug is in 25 mL?

- Set up ratio: $10 \text{ mL} / 50 \text{ mg} = 25 \text{ mL} / x$

- Cross-multiplied: $10x = 25 \times 50$
- Calculate: $10x = 1250$
- $x = 125 \text{ mg}$

- Dosage Calculations

Proper dosage calculations are critical for patient safety.

Types of Dosage Calculations

- Dose calculations based on weight/body surface area
- Percentage solutions
- Concentrations (e.g., mg/mL)
- Infusion rates

Common Formulae:

- $\text{Dose (mg)} = \text{Dose prescribed (mg/kg)} \times \text{Patient weight (kg)}$
- $\text{Volume to administer} = \text{Dose (mg)} / \text{Concentration (mg/mL)}$

Practical Calculation Techniques from Sean Parsons

- Working with Concentrations

Understanding how to manipulate concentration data is essential.

- Example: To prepare a solution:
 - Desired concentration: 50 mg/mL
 - Amount needed: 250 mg
 - $\text{Volume needed} = 250 \text{ mg} / 50 \text{ mg/mL} = 5 \text{ mL}$

- Dilutions

Dilution calculations are common when preparing solutions from concentrated stock.

- Formula: $C_1V_1 = C_2V_2$

- C_1 = initial concentration
- V_1 = volume of stock solution needed
- C_2 = desired concentration
- V_2 = final volume

Example:

Prepare 100 mL of a 10 mg/mL solution from a stock that is 100 mg/mL.

$$- V_1 = (C_2 \times V_2) / C_1 = (10 \text{ mg/mL} \times 100 \text{ mL}) / 100 \text{ mg/mL} = 10 \text{ mL}$$

- Take 10 mL of stock and dilute to 100 mL total volume.

- Calculating Infusion Rates

Infusion calculations are vital in hospital pharmacy.

$$- \text{Formula: Infusion rate (mL/hr)} = (\text{Dose in mg} / \text{Time in hours}) / \text{Concentration (mg/mL)}$$

Example:

Administer 500 mg over 4 hours with a solution concentration of 50 mg/mL.

$$- \text{Infusion rate} = (500 \text{ mg} / 4 \text{ hr}) / 50 \text{ mg/mL} = (125 \text{ mg/hr}) / 50 \text{ mg/mL} = 2.5 \text{ mL/hr}$$

Understanding the Importance of Pharmacy Calculations

The Role of Calculations in Pharmacy Practice

Pharmacy calculations underpin every aspect of medication dispensing and patient care. From measuring liquid volumes to calculating dosages based on body weight, technicians must be precise and confident in their mathematical skills. Errors in calculations can lead to underdosing, overdosing, or medication errors, emphasizing the need for thorough knowledge and practice.

Key Topics Covered in Pharmacy Calculations for Technicians 5th Edition

This edition covers a wide array of topics including:

- Basic math skills and conversions
- Calculating doses based on weight and age
- Compounding calculations
- Inventory and dispensing calculations
- Understanding formulas and ratios

Mastery of these topics helps technicians ensure accuracy and efficiency in their daily tasks.

Fundamental Math Skills for Pharmacy Technicians

Basic Arithmetic and Number Operations

Before diving into complex calculations, technicians should be comfortable with:

- Addition, subtraction, multiplication, and division
- Working with fractions and decimals
- Converting between fractions, decimals, and percentages

Practicing these skills lays the groundwork for more advanced calculations.

Understanding Units and Conversions

Pharmacy calculations often involve converting between units such as:

- Milligrams (mg) to grams (g)
- Milliliters (mL) to liters (L)
- Grains to grams
- Percentages to weights or volumes

Accurate conversions are crucial for dosing and compounding.

Calculating Dosages in Pharmacy Practice

Basic Dose Calculations

The core formula for dose calculation is:

- **Desired Dose (D)** = (Ordered Dose / Stock Dose) × Quantity of stock

For example, if a medication has a stock strength of 250 mg/5 mL, and the prescribed dose is 500 mg, the calculation would be:

$$(500 \text{ mg} / 250 \text{ mg}) \times 5 \text{ mL} = 10 \text{ mL}$$

Calculations Based on Body Weight

Many medications require dosage calculations based on patient weight:

- **Dose (mg/kg) × Patient weight (kg) = Total dose (mg)**

For example, if a drug dosage is 10 mg/kg and a patient weighs 70 kg:

$$10 \text{ mg/kg} \times 70 \text{ kg} = 700 \text{ mg}$$

Then, determine the volume based on stock concentration.

Calculations for Pediatric Patients

Children often require weight-based dosing. It's essential to:

- Convert weight to kilograms
- Calculate the appropriate dose using the standard formula
- Adjust for age and clinical considerations as necessary

Compounding Calculations and Preparations

Reconstitution Calculations

Reconstitution involves mixing a powdered drug with a specific amount of diluent:

- Determine the total volume needed
- Calculate the amount of powder required based on concentration

For example, if a label states that 250 mg of drug is to be dissolved in 50 mL of diluent, and you need 100 mg, calculate:

$$(100 \text{ mg} / 250 \text{ mg}) \times 50 \text{ mL} = 20 \text{ mL}$$

Creating Suspensions and Solutions

Calculations involve:

- Desired concentration (e.g., mg/mL)
- Total volume needed
- Adjusting the amount of active ingredient accordingly

Inventory and Dispensing Calculations

Quantity and Supply Management

Technicians must accurately calculate:

- Number of units or bottles required for a prescription
- Reordering quantities based on usage rates

Example: If a prescription requires 30 mL of medication, and bottles come in 15 mL sizes, you need two bottles.

Expiration and Storage Calculations

Calculations help determine:

- Stability periods based on reconstitution
- Proper storage conditions for compounded medications

Using Formulas and Ratios Effectively

Understanding and Applying Ratios

Ratios are fundamental in pharmacy calculations:

- Expressed as a:b or a to b
- Used to determine proportions in solutions and mixtures

Example: A ratio of 1:100 means 1 part drug to 100 parts diluent.

Proportions and Cross-Multiplication

Efficiently solving for unknowns:

- Set up proportions based on known and unknown quantities
- Use cross-multiplication to solve for the unknown

Example:

$$250 \text{ mg} / 5 \text{ mL} = 100 \text{ mg} / x \text{ mL}$$

$$\text{Cross-multiplied: } 250 \text{ mg} \times x \text{ mL} = 100 \text{ mg} \times 5 \text{ mL}$$

$$\Rightarrow x = (100 \text{ mg} \times 5 \text{ mL}) / 250 \text{ mg} = 2 \text{ mL}$$

Question What are the key factors to consider when performing advanced electrical load calculations? Key factors include the diversity factor, load factor, safety margins, power factor correction, and the specific requirements of the electrical devices and systems involved to ensure accurate and safe capacity planning. How do you calculate the total cable cross-sectional area required for an advanced electrical installation? Calculate the total current load, determine the cable's current-carrying capacity based on specifications, apply correction factors for installation conditions, and select a cable size that exceeds the maximum expected load with appropriate safety margins. What methods are used for fault current calculations in complex electrical systems? Methods include symmetrical components analysis, per-unit system calculations, and software-based simulation tools that consider system impedance, source characteristics, and fault types to accurately determine prospective fault currents. How is power factor correction integrated into advanced electrical installation calculations? Power factor correction is calculated by determining the reactive power needed to offset inductive loads, selecting appropriate capacitor banks, and calculating their size to improve overall system power factor while ensuring voltage stability. What are the considerations for calculating voltage drop in large-scale electrical installations? Considerations include total current load, conductor length, conductor material and size, permissible voltage drop limits, and load distribution to ensure voltage levels remain within acceptable standards throughout the system. How do you perform detailed short-circuit and coordination studies in advanced electrical systems? These studies involve modeling system components, calculating prospective short-circuit currents at various points, selecting appropriate protective devices, and ensuring coordination to isolate faults without unnecessary system outages. What role does harmonics analysis play in advanced electrical installation calculations? Harmonics analysis identifies distortion in the power system caused by non-linear loads, allowing for calculations that ensure harmonic resonance, proper filtering, and compliance with standards to prevent equipment damage. How are thermal limitations of conductors factored into advanced electrical installation calculations? Thermal limitations are considered by calculating the continuous current capacity of conductors, factoring in ambient temperature, grouping, and insulation type to prevent overheating and ensure safe operation. What software tools are commonly used for advanced electrical installation calculations? Common tools include ETAP, SKM Power Tools, DigSilent PowerFactory, and CYME, which facilitate detailed load flow, short-circuit, harmonic, and protection coordination analyses. How do advanced electrical installation calculations ensure compliance with local standards and codes? They involve consulting relevant standards such as NEC, IEC, or local electrical codes, applying their requirements during calculations, and documenting compliance through detailed analysis and reports for inspection and approval.
