Common Types of Drug Dosage Practice Problems

Practicing a variety of problem types prepares students for the complexity of real-world medication calculations. Below are some common categories:

Basic Dosage Calculations

These involve straightforward calculations such as determining the amount of medication to administer based on prescribed doses.

- **Example:** A patient needs 500 mg of a medication. The available medication is 250 mg per tablet. How many tablets should be administered?

Unit Conversions

Converting between measurement systems (e.g., mg to g, mL to L, teaspoons to milliliters) is fundamental.

- **Example:** Convert 0.75 grams to milligrams.

Flow Rate and Infusion Calculations

These problems involve calculating the rate at which fluids or medications should be infused, often based on time, volume, and concentration.

- **Example:** An IV infusion of 1000 mL of fluid is to be administered over 8 hours. What is the flow rate in mL/hour?

Calculating Dosages Based on Body Weight

Many medications are dosed according to patient weight, requiring calculations to determine the correct amount.

- **Example:** A medication requires 2 mg/kg. The patient weighs 70 kg. What is the total dose?

Step-by-Step Approach to Solving Drug Dosage Problems

Developing a systematic approach helps students reduce errors and improve efficiency.

1. Read the Prescription Carefully

Identify the key information: drug name, prescribed dose, form, concentration, route, and timing.

2. Identify What Is Known and What Is Needed

Determine the amount to administer and the available drug form or concentration.

3. Convert Units as Necessary

Ensure all measurements are in compatible units before calculations.

4. Apply the Appropriate Formula

Common formulas include:

- $\text{Desired Dose} = (\text{Desired Dose} / \text{Dose on Hand}) \times \text{Quantity}$
- $\text{Rate (mL/hr)} = \text{Total Volume} / \text{Time (hours)}$
- $\text{Dosage based on weight} = \text{Dose per kg} \times \text{Patient weight}$

5. Perform the Calculation Carefully

Double-check each step and calculation to avoid errors.

6. Verify the Final Answer

Ensure the answer makes sense in the clinical context and matches the prescription.
