Sample Multiple Choice Questions in Industrial Microbiology

Below are several example MCQs, each accompanied by an in-depth explanation to clarify the

correct answer and reinforce learning.

Question 1: Microbial Fermentation

Which of the following best describes the primary difference between batch and continuous fermentation processes?

- A) Batch fermentation involves multiple inoculations, whereas continuous fermentation uses a single inoculation.
- B) Batch fermentation operates without any input or output during the process, while continuous fermentation involves ongoing addition of nutrients and removal of products.
- C) Batch fermentation always produces higher yields compared to continuous fermentation.
- D) Continuous fermentation is only suitable for aerobic microorganisms, whereas batch fermentation is suitable for anaerobic microorganisms.

Correct Answer: B) Batch fermentation operates without any input or output during the process, while continuous fermentation involves ongoing addition of nutrients and removal of products.

Explanation:

In batch fermentation, the microorganisms are inoculated into a fixed volume of medium, and the process runs without adding or removing anything until completion. The entire culture is harvested at the end. Conversely, continuous fermentation involves the steady addition of fresh nutrients and simultaneous removal of culture broth containing products, allowing for prolonged operation and often more consistent yields. This fundamental difference impacts process control, productivity, and scalability.

Question 2: Microbial Strains and Product Formation

Which microorganism is most commonly used in industrial ethanol production?

- A) *Saccharomyces cerevisiae*
- B) *Lactobacillus acidophilus*
- C) *Escherichia coli*
- D) *Aspergillus niger*

Correct Answer: A) *Saccharomyces cerevisiae*

Explanation:

Saccharomyces cerevisiae, commonly known as baker's or brewer's yeast, is the primary organism used in industrial ethanol fermentation, especially in brewing and bioethanol industries. It efficiently converts sugars into ethanol and carbon dioxide under anaerobic conditions. *Lactobacillus acidophilus* is used in probiotic products; *E. coli* is employed in recombinant protein production but not typically for ethanol; *Aspergillus niger* is used for enzyme production and citric acid.

Question 3: Bioreactor Parameters

Which parameter is most critical to control in an aerobic fermentation process to maximize product yield?

- A) pH
- B) Oxygen concentration
- C) Temperature
- D) Agitation speed

Correct Answer: B) Oxygen concentration

Explanation:

While pH, temperature, and agitation are vital, oxygen concentration is particularly crucial in aerobic fermentation because oxygen availability directly influences microbial metabolism and product formation rates. Insufficient oxygen can lead to reduced growth and yields, while excess oxygen may cause oxidative stress or unnecessary energy consumption.

Question 4: Downstream Processing

Which technique is most commonly used for the removal of microbial cells from fermentation broth?

- A) Distillation
- B) Centrifugation
- C) Chromatography

D) Lyophilization

Correct Answer: B) Centrifugation

Explanation:

Centrifugation is widely used to separate microbial cells from fermentation broth due to its efficiency and scalability. Cells are spun at high speeds, causing them to sediment and be collected separately from the liquid containing the desired product. Chromatography is used for purification, distillation for separating volatile compounds, and lyophilization for drying.

Question 5: Genetic Engineering in Industrial Microbiology

What is the primary purpose of recombinant DNA technology in industrial microbiology?

- A) To increase the pathogenicity of microbial strains
- B) To produce genetically uniform microbial populations
- C) To enhance production of specific metabolites or proteins
- D) To eliminate the need for fermentation processes

Correct Answer: C) To enhance production of specific metabolites or proteins

Explanation:

Recombinant DNA technology allows scientists to insert, delete, or modify genes within microbial genomes to increase yields of desired products such as enzymes, antibiotics, or biofuels. It is a cornerstone of modern strain improvement strategies. Increasing pathogenicity is undesirable; producing uniform populations is a result but not the primary purpose; and it does not eliminate fermentation but optimizes it.
