Step-by-step development of the flow chart

1. Initial screening: Gram stain and morphology

The identification process begins with the primary observation of bacterial morphology using Gram staining:

- Gram stain results: Gram-negative rods
- Colony morphology: Large, spreading, and swarming colonies on blood agar

These initial features suggest members of the Enterobacteriaceae family, prompting further testing.

2. Motility testing

Motility is a distinguishing trait:

- Test method: Semisolid motility medium (e.g., motility indole medium or motility test tube)
- Result interpretation:
 - Motile: Swarming motility characteristic of *Proteus* spp.
 - Non-motile: Consider other genera

Proteus vulgaris exhibits characteristic swarming motility, setting it apart from *Proteus mirabilis*, which also swarms but exhibits different biochemical traits.

3. Observation of swarming behavior

- Swarming colonies: Rapid, concentric, spreading growth pattern
- Significance: Confirms motility and hints at *Proteus* genus

4. Hemolysis pattern on blood agar

- Beta-hemolysis: Complete lysis (common in *Proteus vulgaris*)
- Alpha or gamma hemolysis: Less suggestive but still considered

The hemolytic pattern provides supportive evidence alongside biochemical tests.

5. Biochemical testing series

This is the core of the identification process, with each test providing specific insights:

a. Indole production

- Method: Kovac's reagent
- Result:
- Positive: Red or pink layer? Proteus vulgaris is indole positive
- Negative: No color change; Proteus mirabilis is typically indole negative

b. Urease activity

- Negative: No color change

Proteus vulgaris is urease positive, aiding differentiation from other bacteria.

c. Hydrogen sulfide (H₂S) production

- Method: SIM medium or iron agar
- Result:
- Positive: Black precipitate indicates H₂S production
- Negative: No black precipitate

d. Lactose fermentation

- Method: MacConkey agar or phenol red lactose broth
- Result:
- Ferments lactose: Pink colonies or acid production
- Does not ferment: Colorless or no acid change

Proteus vulgaris is usually lactose negative or variable, helping distinguish it from Proteus mirabilis, which is typically lactose negative.

e. Additional tests (if needed):

- Citrate utilization: Positive in Proteus vulgaris
