How does load balancing work in Citrix NetScaler? Citrix NetScaler distributes incoming network traffic across multiple servers based on configured algorithms (like round-robin, least connections, or URL hashing) to ensure optimal resource utilization and high availability. What

are the key components of a Citrix NetScaler setup? Key components include virtual servers (vServers), service groups, load balancing methods, SSL offloading, and policies for traffic management and security. How do you configure SSL offloading on Citrix NetScaler? SSL offloading involves uploading an SSL certificate to the NetScaler, creating an SSL virtual server, and binding the certificate to terminate SSL connections, reducing server load and improving performance. What is the purpose of Content Switching in Citrix NetScaler? Content Switching allows the NetScaler to route incoming requests to different backend services based on URL or other content-based policies, enabling multi-application hosting on a single NetScaler. How does Citrix NetScaler enhance security for web applications? NetScaler provides features like Web Application Firewall (WAF), SSL encryption, application-layer security policies, and integrated DDoS protection to safeguard web applications from threats. What are the different deployment modes of Citrix NetScaler? Citrix NetScaler can be deployed in various modes including standalone, high availability (HA) pairs, and in cloud environments, depending on scalability and redundancy requirements. How do you monitor and troubleshoot issues in Citrix NetScaler? Monitoring is done through built-in dashboards, logs, and SNMP. Troubleshooting involves analyzing traffic logs, using diagnostic commands, and checking configurations for errors. What is the difference between a virtual server and a service in Citrix NetScaler? A service represents a backend resource (like a web server), while a virtual server (vServer) is the logical entity that receives client requests and load balances traffic to associated services. How can you secure access to Citrix NetScaler management interface? Secure access involves configuring strong authentication, SSL encryption for the management interface, IP whitelisting, and restricting access using firewalls and VPNs.
