Question 1: Describe the structure of a typical plant cell and explain its functions.

Answer:

A typical plant cell consists of several specialized structures called organelles, each with specific functions:

- Cell Wall: Provides rigidity and protection; made of cellulose.
- Cell Membrane: Controls what enters and exits the cell.
- Cytoplasm: Gel-like fluid where metabolic reactions occur.
- Nucleus: Contains genetic material (DNA) and controls cell activities.

These structures work together to support the plant's growth, photosynthesis, and overall function.

Question 2: Explain the process of photosynthesis and why it is vital for life on Earth.

Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose. The overall equation is:

Process overview:

- Light Absorption: Chlorophyll absorbs light energy, primarily from the blue and red wavelengths.
- Light-Dependent Reactions: Occur in the thylakoid membranes, where light energy splits water molecules (photolysis), releasing oxygen, and generates ATP and NADPH.
- Light-Independent Reactions (Calvin Cycle): Occur in the stroma, where ATP and NADPH are used to convert carbon dioxide into glucose.

Importance of photosynthesis:

- Produces oxygen essential for respiration in most organisms.
- Forms the base of food chains, supporting heterotrophic life.
- Regulates atmospheric carbon dioxide, helping to mitigate climate change.

Question 3: Calculate the probability of inheriting a recessive trait in a monohybrid cross where both parents are heterozygous.

Answer:

When both parents are heterozygous (Aa), the Punnett square is:

| A | a |

---|---|---

| A | AA | Aa |

| a | Aa | aa |

Genotypic ratio:

- 1 AA (homozygous dominant)
- 2 Aa (heterozygous)
- 1 aa (homozygous recessive)

Probability of recessive trait (aa): 1 out of 4, or 25%.

Thus, there's a 25% chance the offspring will inherit the recessive trait.

Whether you are revising for your upcoming assessment or seeking to deepen your understanding, this guide offers a structured and comprehensive overview of the core topics within Biology Unit 2.

Understanding Cell Structure and Function

Types of Cells: Prokaryotic vs. Eukaryotic

One of the fundamental topics in Biology Unit 2 revolves around differentiating between prokaryotic and eukaryotic cells. This distinction is essential because it underpins many biological processes and the organization of life forms.

Prokaryotic Cells:

- Lack a true nucleus; their genetic material is free-floating within the cytoplasm.
- Generally smaller and simpler in structure.
- Examples include bacteria and archaea.
- Features include a cell wall, plasma membrane, cytoplasm, ribosomes, and sometimes flagella or pili.
- DNA is typically a single circular molecule.

Eukaryotic Cells:

- Possess a true nucleus that encloses the genetic material.
- Larger and more complex.
- Examples include plant, animal, fungi, and protist cells.
- Contain membrane-bound organelles such as the mitochondria, endoplasmic reticulum, Golgi apparatus, and chloroplasts (in plant cells).

Key Differences and Their Significance:

- The presence of membrane-bound organelles allows eukaryotic cells to compartmentalize functions, increasing efficiency and specialization.
- Prokaryotic cells are often more adaptable and can reproduce rapidly, which is significant in contexts like bacterial infections or industrial applications.

Cell Components and Their Functions

Understanding the roles of various cell organelles is critical for explaining biological processes.

Nucleus:

- Acts as the control center, containing genetic material (DNA).

- Coordinates cell activities such as growth, metabolism, protein synthesis, and reproduction.

Mitochondria:

- Known as the powerhouses of the cell.
- Site of aerobic respiration, producing ATP, the cell's energy currency.

Ribosomes:

- Responsible for protein synthesis.
- Found freely in the cytoplasm or attached to the endoplasmic reticulum.

Endoplasmic Reticulum (ER):

- Rough ER: Studded with ribosomes; involved in protein folding and transport.
- Smooth ER: Synthesizes lipids and detoxifies substances.

Golgi Apparatus:

- Modifies, sorts, and packages proteins and lipids for secretion or internal use.

Chloroplasts (in plant cells):

- Conduct photosynthesis, converting light energy into chemical energy stored as glucose.

Cell Wall:

- Provides structural support and protection.
- Composed mainly of cellulose in plants.

Plasma Membrane:

- Regulates what enters and exits the cell.
- Maintains homeostasis through selective permeability.

Biological Molecules: Structure and Function

Carbohydrates

Carbohydrates serve as primary energy sources and structural components.

- Substrate Concentration: higher concentration increases rate until saturation.
- Inhibitors: substances that reduce enzyme activity, e.g., competitive or non-competitive inhibitors.

Enzyme-Substrate Specificity and Lock-and-Key Model

- Enzymes are highly specific; only fit certain substrates.
- The lock-and-key analogy illustrates the precise fit between enzyme active sites and substrates.
- Induced fit model suggests enzymes change shape slightly upon substrate binding for a better fit.

Cellular Respiration and Photosynthesis
