Describe how the process of subduction contributes to the formation of mountain ranges.

Answer:

Subduction occurs when an oceanic plate collides with a continental plate, and the denser oceanic plate sinks beneath the continental plate into the mantle. This process leads to the melting of the subducted plate, resulting in magma that can form volcanic arcs. The collision and subsequent compression cause crustal uplift, forming mountain ranges such as the Andes.

Question 2:

Explain the role of greenhouse gases in Earth's climate system.

Answer:

Greenhouse gases, such as carbon dioxide and methane, trap heat within Earth's atmosphere through the greenhouse effect. They allow sunlight to enter but prevent some of the infrared radiation from escaping back into space, maintaining a habitable temperature on Earth. An increase in these gases can lead to global warming and climate change.

Sample Question Breakdown and Detailed Answers

Let's analyze some typical questions found in physical science review packets, with detailed explanations to foster a deeper understanding.

1. Newton's Second Law: $F = ma$

Question: A 5 kg object accelerates at 4 m/s^2 . What is the net force acting on the object?

Answer:

Using Newton's second law,

$$F = m \times a$$

$$F = 5 \text{ kg} \times 4 \text{ m/s}^2 = 20 \text{ N}$$

Explanation:

The net force is directly proportional to the mass and acceleration. Here, the object experiences a force of 20 Newtons in the direction of acceleration.

Key Point:

Remember that if multiple forces act in different directions, you must consider vector addition to find the net force.

2. Conservation of Energy

Question: An object is dropped from a height of 20 meters. Assuming no air resistance, what is its speed just before hitting the ground?

Answer:

Using the conservation of energy:

Potential energy at the top = Kinetic energy at the bottom

$$mgh = (1/2) mv^2$$

Cancel m from both sides:

$$gh = (1/2) v^2$$

Solve for v:

$$v = \sqrt{2gh}$$

Plugging in values:

$$g = 9.8 \text{ m/s}^2$$

$$v = \sqrt{2 \times 9.8 \text{ m/s}^2 \times 20 \text{ m}} = \sqrt{392} \approx 19.8 \text{ m/s}$$

Explanation:

This calculation demonstrates the conversion of potential energy to kinetic energy during free fall, assuming no air resistance.

Tip:

Always confirm the units and check if the problem involves energy conservation or forces directly.

3. Atomic Structure and the Periodic Table

Question: How many electrons can the third energy level hold? Which element has this number of electrons in its outermost shell?

Answer:

The maximum number of electrons in an energy level is given by $2n^2$, where n is the principal quantum number.

For $n=3$:

$$2 \times (3)^2 = 2 \times 9 = 18 \text{ electrons}$$

Elements in period 3 of the periodic table have up to 18 electrons in their outermost shell. For example, Argon (Ar) has 18 electrons, filling its third shell.

Explanation:

Understanding electron configurations helps in predicting element properties and reactivity.
