- Future Worth Analysis: Determining the value at a specific future date, taking into account compounding.
- Net Present Value (NPV): Comparing the present value of benefits and costs to evaluate project feasibility.
- Internal Rate of Return (IRR): Finding the discount rate that equates the present value of benefits and costs.

For example, when calculating the NPV of a proposed investment, the solution manual guides users through:

- Listing all cash flows over the project's lifespan.
- Selecting an appropriate discount rate.
- Discounting each cash flow to present value.
- Summing discounted benefits and costs.
- Interpreting the results to inform decision-making.

Economic Equivalence and Comparison of Alternatives

The manual emphasizes the importance of establishing economic equivalence when comparing projects with different cash flow patterns. It provides methods such as:

- Equivalent Annual Cost (EAC): Converting a present worth into an equal annual series to compare alternatives with different lifespans.
- Capitalized Cost: Calculating the cost of an asset assuming perpetual operation, useful for long-term comparison.

Example: When analyzing two machinery options with different purchase prices and operating costs, the solution manual shows how to compute the EAC for each to determine the more economical choice.

Replacement and Maintenance Decisions

The manual offers detailed procedures for:

- Determining the optimal time to replace equipment based on economic criteria.
- Calculating the equivalent uniform annual cost (EUAC) for different replacement intervals.
- Incorporating salvage values and trade-in options into the analysis.

This approach enables engineers to optimize operational efficiency and cost-effectiveness over the equipment's life cycle.

Practical Applications and Case Studies

The solutions provided are not merely academic; they reflect real-world applications. The 11th edition includes case studies covering:

- Manufacturing plant investments
