Common Problems and How to Solve Them: MBA Solutions for Module 22

Problem 1: Analyzing Financial Ratios for Decision-Making

Scenario: You are provided with financial statements of a company and asked to assess its liquidity and profitability.

Solution Approach:

- Calculate relevant ratios: current ratio, quick ratio, return on assets (ROA), return on equity (ROE)
- Interpret ratios in context: compare with industry benchmarks
- Identify areas of concern or strength
- Provide strategic recommendations based on analysis

Example:

| Ratio | Calculation | Interpretation |

|---|---|---|

| Current Ratio | Current Assets / Current Liabilities | Indicates liquidity position |

| ROE | Net Income / Shareholders' Equity | Measures profitability for shareholders |

Tip: Use trend analysis over multiple periods to identify improvements or deteriorations.

Problem 2: Calculating Break-Even Point in Units and Dollars

Scenario: Determine the sales volume required to cover all fixed and variable costs.

Solution Steps:

- Identify fixed costs (FC)
- Determine variable cost per unit (VCU)
- Find contribution margin per unit (CMU) = Selling Price per unit (SP) - VCU
- Calculate break-even point in units:

\[

$$\text{Break-even units} = \frac{FC}{CMU}$$

\]

- Calculate break-even sales in dollars:

\[

$$\text{Break-even sales} = \text{Break-even units} \times SP$$

\]

Example:

If FC = \$50,000, VCU = \$20, SP = \$50

\[

$$\text{CMU} = 50 - 20 = 30$$

\]

\[

$$\text{Break-even units} = 50,000 / 30 \approx 1667 \text{ units}$$

\]

\[

$$\text{Break-even sales} = 1667 \times 50 = \$83,350$$

\]

Problem 3: Evaluating Investment Projects Using NPV and IRR

Scenario: An organization is considering a project with initial investment, expected cash flows, and a required rate of return.

Solution Approach:

- Calculate the Present Value (PV) of future cash flows discounted at the required rate
- Determine NPV:

\[

$$\text{NPV} = \sum_{t=1}^n \frac{\text{CF}_t}{(1 + r)^t} - \text{Initial Investment}$$

\]

- Find IRR: the discount rate at which NPV = 0

Decision Rules:

- Accept the project if NPV > 0
- Accept if IRR > required rate of return

Example:

Initial Investment = \$100,000

Cash flows over 3 years: \$40,000, \$50,000, \$60,000

Required rate = 10%

Calculate NPV and IRR to decide.

Sample Solutions for Common Module 17 Problems

To illustrate how to approach and solve typical problems in Module 17, here are some sample scenarios with solutions.

Scenario 1: Consolidation of Financial Statements

Problem:

A parent company owns 80% of a subsidiary. The subsidiary reports a net income of \$200,000, and the parent's share of this income needs to be consolidated. The subsidiary's retained earnings before consolidation are \$500,000, and there are inter-company receivables of \$50,000.

Solution:

- Calculate the Parent's share of subsidiary income:

- Ownership percentage: 80%
- Share of net income: $\$200,000 \times 80\% = \$160,000$

- Eliminate inter-company receivables:

- Remove the receivable of \$50,000 from the consolidated balance sheet.

- Adjust for non-controlling interest (if applicable):

- Non-controlling interest (NCI): 20% of net assets.
- NCI share of net income: $\$200,000 \times 20\% = \$40,000$

- Prepare consolidated statement:

- Combine parent and subsidiary figures, subtract inter-company balances, and allocate net income accordingly.

Result:

The consolidated net income equals parent's net income plus subsidiary's income minus inter-company profit (if any). The NCI's share is reflected separately in the equity section.

Scenario 2: Foreign Currency Translation

Problem:

A subsidiary reports a functional currency of EUR. The subsidiary's balance sheet as of December 31, 2023, shows assets of ?1,000,000, liabilities of ?600,000, and equity of ?400,000. The exchange rate at year-end is 1 EUR = 1.2 USD. The historical rate for assets was 1 EUR = 1.1 USD.

Solution:

- **Translate assets and liabilities at the closing rate:**

- Assets: $?1,000,000 \times 1.2 = \$1,200,000$

- Liabilities: $?600,000 \times 1.2 = \$720,000$

- **Translate equity at historical rate:**

- Equity: $?400,000 \times 1.1 = \$440,000$

- **Calculate translation adjustment:**

- Difference between assets and liabilities: $\$1,200,000 - \$720,000 = \$480,000$

- Compare with translated equity to identify unrealized gains or losses.

- **Record translation adjustments in other comprehensive income (OCI):**

- Adjust for the difference in the equity section as per IAS 21.

Result:

The translation process results in a foreign currency translation adjustment that is recognized in OCI, affecting the consolidated financial statements.

Sample Solutions for Common Financial Accounting Problems

Below are illustrative solutions to typical problems faced in Module 9:

Problem 1: Analyzing a Company's Liquidity

Scenario:

A company's balance sheet shows current assets of \$500,000 and current liabilities of \$250,000.

Solution:

Calculate the current ratio:

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities} = \$500,000 / \$250,000 = 2.0$$

Interpretation:

A current ratio of 2.0 indicates good short-term liquidity, suggesting the company can comfortably meet its short-term obligations.

Problem 2: Choosing Inventory Valuation Method

Scenario:

A company with rising inventory costs needs to decide between FIFO and LIFO.

Solution:

- FIFO (First-In, First-Out) results in lower cost of goods sold and higher net income during inflation, but higher taxes.
- LIFO (Last-In, First-Out) aligns with current costs, reducing taxable income and income taxes but may understate inventory value.

Strategic Advice:

Select FIFO if the focus is on showing higher profits; choose LIFO for tax advantages during inflation periods.

Problem 3: Recording Depreciation

Scenario:

A machine costing \$100,000 with an estimated useful life of 10 years and salvage value of \$10,000.

Solution:

Straight-line depreciation per year:

$$(\text{Cost} - \text{Salvage Value}) / \text{Useful Life} = (\$100,000 - \$10,000) / 10 = \$9,000$$

Application:

Record \$9,000 as depreciation expense annually for 10 years, reducing the book value of the asset accordingly.
