Core Principles of Pharmacology Covered in the 7th Edition

The textbook systematically explores fundamental principles that guide the understanding of how drugs interact with biological systems. These principles serve as the backbone of pharmacology and are crucial for safe and effective drug use.

1. Pharmacokinetics

Pharmacokinetics involves the study of how drugs move through the body, encompassing absorption, distribution, metabolism, and excretion (ADME).

- **Absorption:** The process by which a drug enters the bloodstream from its site of administration.
- **Distribution:** Dispersion of the drug throughout body fluids and tissues.
- **Metabolism:** Biotransformation of drugs, mainly in the liver, converting them into more water-soluble compounds.
- **Excretion:** Removal of drugs and their metabolites via urine, bile, or other routes.

Understanding pharmacokinetics helps determine dosing regimens, onset of action, and duration of therapeutic effects.

2. Pharmacodynamics

Pharmacodynamics focuses on the biochemical and physiological effects of drugs and their mechanisms of action.

- **Receptor interactions:** Drugs act by binding to specific receptors to activate or inhibit biological responses.
- **Dose-response relationships:** The correlation between drug dose and the magnitude of effect.
- **Tolerance and dependence:** Changes in drug response over time and potential for addiction.

A thorough understanding of pharmacodynamics enables clinicians to optimize drug efficacy and minimize adverse effects.

- d) Activation of prostacyclin synthesis

Answer: a) Inhibition of cyclooxygenase (COX) enzymes

Explanation:

Aspirin irreversibly inhibits COX enzymes (mainly COX-1 and COX-2), reducing prostaglandin and thromboxane synthesis. This leads to its anti-inflammatory, analgesic, antipyretic, and antiplatelet effects.

3. Which pharmacokinetic process describes the movement of a drug from the bloodstream into the tissues?

- a) Absorption
- b) Distribution
- c) Metabolism
- d) Excretion

Answer: b) Distribution

Explanation:

Distribution involves the movement of a drug from the bloodstream into tissues and organs. Absorption refers to drug entry into systemic circulation, metabolism involves biotransformation, and excretion is the removal of drugs and metabolites.
