Technical Capabilities and Methodologies

The strength of the AGT Cytogenetics Laboratory lies in its diverse array of cytogenetic and molecular techniques, allowing it to address a broad spectrum of clinical scenarios.

Standard Karyotyping

Karyotyping remains the cornerstone of cytogenetic testing. AGT employs high-resolution G-banding

techniques to analyze metaphase chromosomes from cultured cells. This method enables detection of:

- Numerical abnormalities (e.g., trisomies, monosomies)
- Structural rearrangements (e.g., translocations, inversions, deletions, duplications)

The laboratory's protocols optimize cell culture conditions to ensure optimal metaphase spreads, critical for accurate interpretation.

Fluorescence In Situ Hybridization (FISH)

FISH complements karyotyping by enabling targeted analysis of specific chromosomal regions. AGT utilizes fluorescently labeled DNA probes to identify:

- Microdeletions (e.g., DiGeorge syndrome)
- Marker chromosomes
- Gene rearrangements

FISH's rapid turnaround and high sensitivity make it invaluable for confirming ambiguous karyotype findings or detecting submicroscopic aberrations.

Chromosomal Microarray Analysis (CMA)

Recognizing the limitations of traditional cytogenetics in detecting small copy number variations (CNVs), AGT incorporates CMA into its testing repertoire. Using array-based comparative genomic hybridization (aCGH) or SNP arrays, the lab detects:

- Submicroscopic deletions and duplications
- Uniparental disomy
- Regions of homozygosity

CMA provides higher resolution than karyotyping, crucial for diagnosing intellectual disabilities, developmental delays, and congenital anomalies.

Next-Generation Sequencing (NGS) and Molecular Techniques
