Whether you're preparing for exams, updating your clinical practice, or seeking a thorough overview of haematology, Hoffbrand's Essential Haematology provides invaluable knowledge grounded in scientific evidence and clinical relevance.

Introduction to Haematology

Haematology is the branch of medicine focused on the study of blood, blood-forming tissues, and disorders related to blood components. Blood plays a crucial role in oxygen transport, immune defense, clotting, and maintaining homeostasis. Understanding haematology involves knowledge of blood cell production, function, and the pathologies that affect these processes.

Key Components of Blood

- Red Blood Cells (Erythrocytes): Responsible for oxygen transport via hemoglobin.
- White Blood Cells (Leukocytes): Key players in immune defense, including lymphocytes, neutrophils, monocytes, eosinophils, and basophils.
- Platelets (Thrombocytes): Essential for clot formation and wound healing.
- Plasma: The liquid component containing nutrients, hormones, waste products, and clotting factors.

Fundamentals of Blood Formation and Regulation

Hematopoiesis

Hematopoiesis refers to the process of blood cell production, primarily occurring in the bone marrow. It involves stem cells differentiating into various blood cell lineages under the influence of growth factors.

Key Growth Factors and Cytokines:

- Erythropoietin (EPO): Stimulates red blood cell production.
- Granulocyte Colony-Stimulating Factor (G-CSF): Promotes neutrophil proliferation.
- Thrombopoietin (TPO): Regulates platelet production.
- Interleukins: Support proliferation and differentiation of lymphocytes.

Regulation of Hematopoiesis

Hematopoiesis is tightly regulated by feedback mechanisms responsive to the body's needs, such as hypoxia stimulating erythropoietin release from the kidneys to increase red blood cell production.

Blood Tests and Diagnostic Techniques

Effective diagnosis of haematologic disorders relies on a range of laboratory tests:

Complete Blood Count (CBC)

A routine test providing information on:

- Hemoglobin levels
- Hematocrit
- Red cell indices (MCV, MCH, MCHC)
- White cell count and differential
- Platelet count

Blood Smears and Morphology

Microscopic examination of blood films helps identify abnormal cell shapes, sizes, or inclusions indicative of specific diseases.

Bone Marrow Examination

In cases of unexplained cytopenias or hematologic malignancies, bone marrow aspirates and biopsies provide insight into marrow cellularity and morphology.

Specialized Tests

- Hemoglobin electrophoresis for hemoglobinopathies
- Coagulation profile (PT, aPTT, INR)
- Flow cytometry for lymphocyte populations
- Molecular diagnostics (PCR, FISH)
