```

```
...
```

These fundamental steps set the stage for applying Gonzalez's core techniques such as filtering, enhancement, and segmentation.

Image Enhancement Techniques

Enhancement aims to improve the visual appearance of images or emphasize certain features. Gonzalez categorizes enhancement into spatial domain and frequency domain methods.

Spatial Domain Techniques

- Contrast Stretching

This technique improves image contrast by expanding the range of intensity levels.

Implementation in MATLAB:

```
```matlab
```

```
min_val = min(gray_img(:));
```

```
max_val = max(gray_img(:));
```

```
stretched_img = imadjust(gray_img, [min_val/255; max_val/255], [0; 1]);
```

```
imshow(stretched_img);
```

```
title('Contrast Stretched Image');
```

```
...
```

#### - Histogram Equalization

Widely used to improve global contrast, especially in images with backgrounds and foregrounds that

are both bright or both dark.

Implementation:

```
```matlab

heq_img = histeq(gray_img);

imshow(heq_img);

title('Histogram Equalized Image');

```
```

#### - Spatial Filtering

Example: Median Filter for noise reduction

```
```matlab

denoised_img = medfilt2(gray_img, [3 3]);

imshow(denoised_img);

title('Median Filtered Image');

```
```

## Frequency Domain Techniques

Transforms like the Fourier Transform enable filtering in the frequency domain.

Example: Low-pass filtering to remove high-frequency noise:

```
```matlab

% Fourier Transform
```

```
F = fft2(double(gray_img));

F_shifted = fftshift(F);

% Create a low-pass filter mask

[M, N] = size(gray_img);

radius = 30;

[X, Y] = meshgrid(1:N, 1:M);

centerX = N/2;

centerY = M/2;

mask = sqrt((X - centerX).^2 + (Y - centerY).^2)
% Apply mask

F_filtered = F_shifted . mask;

% Inverse Fourier Transform

F_ishift = ifftshift(F_filtered);

filtered_img = real(ifft2(F_ishift));

imshow(uint8(filtered_img));

title('Low-pass Filtered Image');

...
```

Image Restoration and Noise Reduction

Images often suffer from degradation due to noise or blurring. Gonzalez emphasizes restoration techniques to recover the original image.

- Noise Models and Filters

- Gaussian Noise: Typically mitigated with spatial filters like Gaussian smoothing.

Implementation:

```
```matlab

h = fspecial('gaussian', [5 5], 1);

restored_img = imfilter(gray_img, h);

imshow(restored_img);

title('Gaussian Filtered Image');

```
```

- Salt & Pepper Noise: Reduced using median filtering.

- Image Deconvolution

Restores images degraded by blur using algorithms like inverse filtering or Wiener filtering.

Wiener Filter Example:

```
```matlab

PSF = fspecial('motion', 20, 45);

blurred = imfilter(gray_img, PSF, 'symmetric', 'conv');

restored = deconvwnr(blurred, PSF, 0.01);

imshow(restored);

title('Wiener Restored Image');

```
```

Image Segmentation: Isolating Regions of Interest

Segmentation divides an image into meaningful parts, facilitating object recognition or measurement.

Methods include:

- Thresholding: Simple and effective for images with distinct intensity differences.

```
```matlab
```

```
level = graythresh(gray_img);
```

```
bw = imbinarize(gray_img, level);
```

```
imshow(bw);
```

```
title('Binary Image after Thresholding');
```

```
```
```

- Edge Detection: Finds boundaries using operators such as Sobel, Prewitt, or Canny.

```
```matlab
```

```
edges = edge(gray_img, 'Canny');
```

```
imshow(edges);
```

```
title('Canny Edge Detection');
```

```
```
```

- Region-based Segmentation: Using region growing or watershed algorithms.

Example: Extracting properties:

```
```matlab  
  
props = regionprops(L, 'Area', 'Perimeter', 'Eccentricity');  
  
disp(props);  
  
...

Introduction to Digital Image Processing

Digital image processing involves the manipulation of digital images through algorithms to enhance, analyze, and interpret visual information. Unlike analog methods, digital processing allows for more precise, flexible, and automated techniques, enabling applications that range from improving the quality of photographs to sophisticated medical diagnostics.

Gonzalez and Woods' book begins with foundational concepts, emphasizing the importance of understanding the nature of digital images, the types of image data, and the basic steps involved in processing images effectively.

Core Concepts and Foundations

What is a Digital Image?

A digital image is a two-dimensional function $f(x, y)$, where x and y denote spatial coordinates, and the function value corresponds to the intensity or color at a particular point. These images are composed of pixels, which are tiny picture elements, each carrying specific intensity or color information.

- Grayscale images: Contain intensity information only, typically represented with 8 bits per pixel (256 levels of gray).
- Color images: Usually composed of three color channels (RGB), each with its own grayscale image.

Basic Image Processing Steps

Gonzalez's text identifies several essential steps in processing images:

- Image Acquisition: Capturing the image via sensors or cameras.
- Preprocessing: Improving image quality via noise reduction, contrast enhancement.
- Segmentation: Partitioning an image into meaningful regions.
- Representation and Description: Extracting features for analysis.
- Recognition and Interpretation: Assigning labels or meanings to objects within the image.

Image Enhancement and Restoration

Enhancing Image Quality

Image enhancement aims to improve visual appearance or to prepare images for further analysis. Techniques include:

- Spatial filtering: Using convolution with specific kernels to emphasize or suppress features.
- Histogram equalization: Improving image contrast by redistributing intensity values.
- Sharpening: Highlighting edges and fine details for clearer images.

Gonzalez emphasizes the importance of selecting the right filter for the task, whether it's smoothing noisy images or accentuating edges to facilitate segmentation.

Restoring Degraded Images

Restoration involves reversing the effects of image degradation caused by noise, blur, or other distortions. This section covers:

- Inverse filtering, which attempts to undo degradation mathematically.
- Wiener filtering, a more advanced method that accounts for noise statistics.
- Blind deconvolution, used when the degradation function is unknown.

These techniques require a solid understanding of the degradation process and are critical in fields like astronomy and medical imaging where clarity is paramount.

Image Segmentation Techniques

Segmentation divides an image into regions of interest, such as objects, backgrounds, or textures. Gonzalez categorizes segmentation methods into:

- Thresholding: Separating objects based on intensity levels.
- Edge detection: Identifying boundaries via gradient-based operators like Sobel or Canny.
- Region-based segmentation: Grouping pixels based on similarity criteria.
- Clustering methods: K-means and fuzzy c-means algorithms for partitioning pixel data.

The second edition expands on the advantages and limitations of each, providing practical insights into their applicability in real-world scenarios.

Morphological Image Processing

Morphological operations analyze geometrical structures within images, often used in binary images but extendable to grayscale images. Key operations include:

- Dilation: Expanding object boundaries.
- Erosion: Shrinking objects.
- Opening and closing: Combining dilation and erosion for noise removal or object smoothing.

These tools are invaluable in preparing images for object recognition or measurement.

Color Image Processing

Color images introduce additional complexity due to multiple channels. Gonzalez discusses:

- Color representations: RGB, HIS (Hue, Intensity, Saturation), and others.
- Color transformations: Converting between color spaces for specific tasks.
- Color image enhancement: Techniques to improve color fidelity or highlight features.

Understanding how to manipulate color data is crucial for applications like digital photography, video processing, and remote sensing.
